IrshadOS

Irshad AI ERP for clinics and hospitals, with EMR

Clinics, hospitals and labs

For clinics, hospitals and labs: an EMR with each patient's history, consultations, diagnoses, prescriptions and lab results, plus appointments with each doctor, inpatient and emergency records, billing that posts to the accounts, medicine stock and staff salaries. Works on a phone.

Patient records (EMR), appointments and lab tests in one place

Each patient has one electronic medical record: history, allergies, vital signs, consultations with diagnoses and prescriptions, and lab results. Patients, appointments, consultations and lab tests open from the Healthcare home, with appointment analytics. The screen suggests the next job: register a patient, book an appointment or order a lab test.

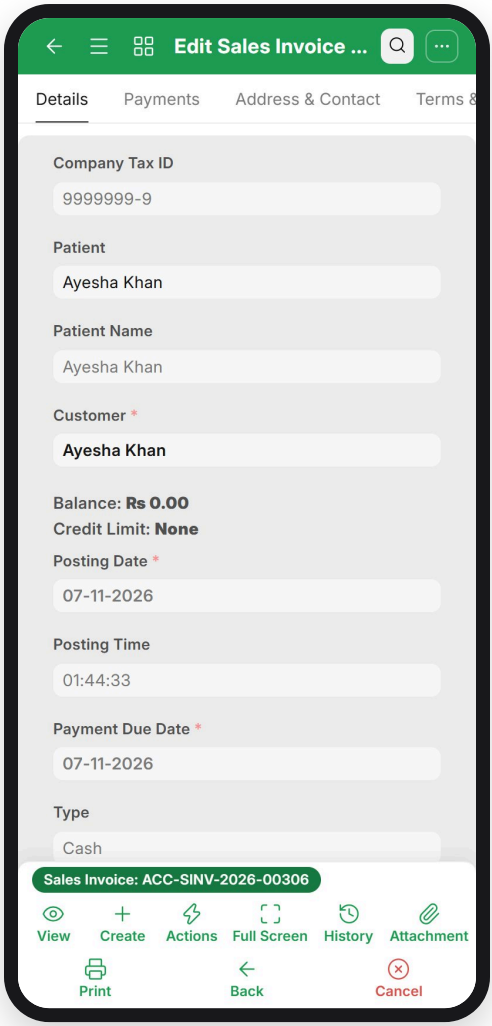

Book a patient with a doctor

Each appointment records the patient, the doctor, the department, the type of visit and the date, against the doctor's schedule. It can be rescheduled or cancelled from the same screen.

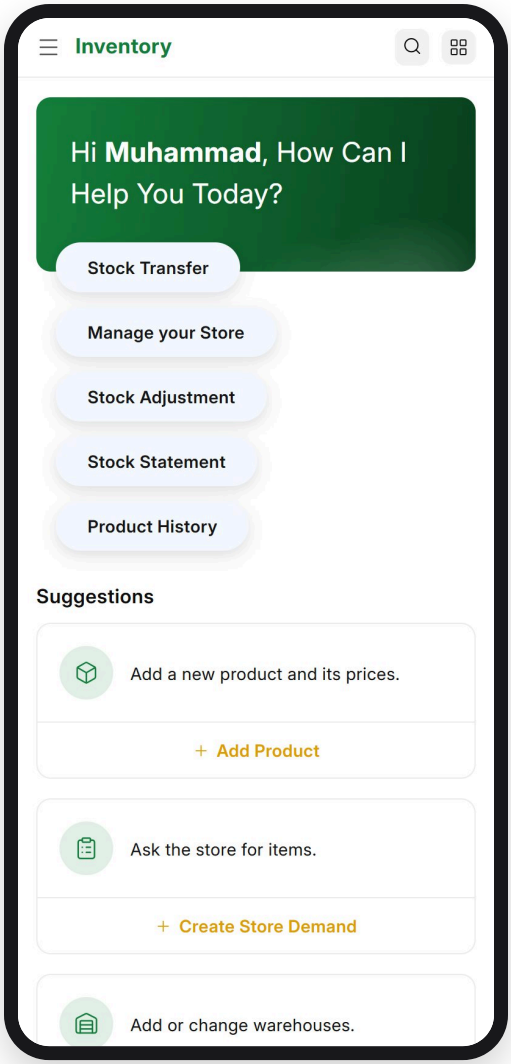

Bills that land in the accounts

A consultation or a test is billed to the patient as an ordinary invoice. The appointment is marked as invoiced, and the money received posts to cash or bank, so the clinic's income is always in its books.

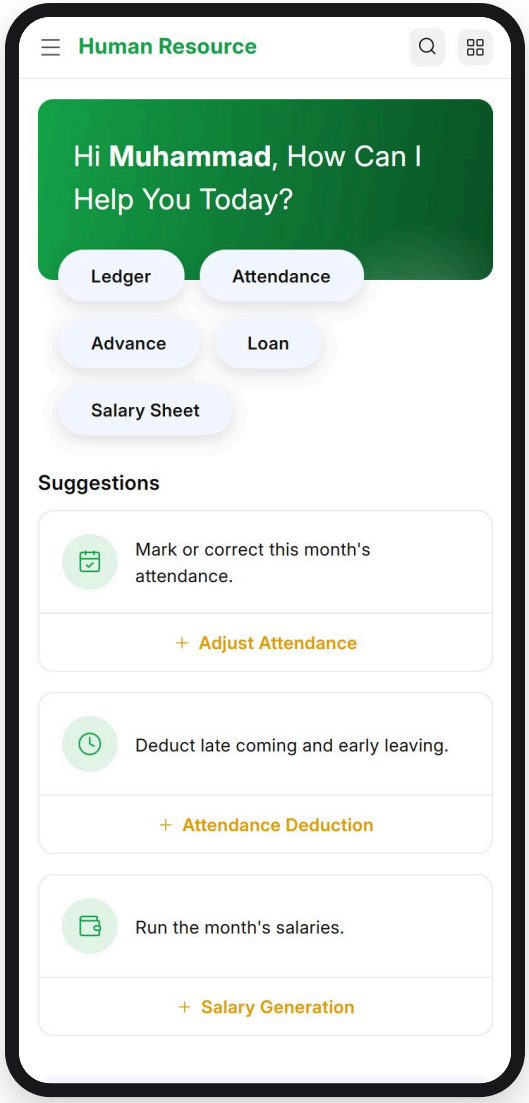

Medicines and supplies in stock

Stock of medicines and supplies in every store, with transfers, adjustments and the history of every item, and purchase orders to the suppliers.

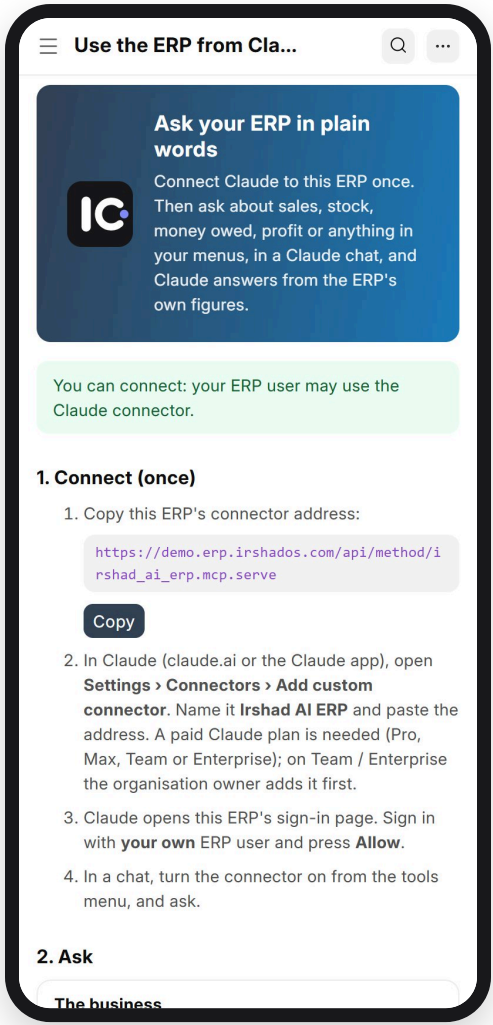

Doctors, nurses and staff salaries

Attendance, leave, advances, loans and the monthly salary sheet, with salary tax slabs set for your country.

Ask your ERP

Ask "how many appointments did each doctor have this month?" or "income from lab tests this week" in plain language, and the answer comes from your own records. Each person sees only what their role allows.

Questions

Is it an EMR?

Yes. It keeps an electronic medical record for every patient, used inside your clinic or hospital along with appointments, billing and stock. It is not a certified EHR for the US or UK, and linking records with other hospitals' systems (HL7 or FHIR) is built on request.

What else does it keep for patients?

Vital signs, consultations, medical records and history, inpatient records, emergency records, medication orders, procedures, discharge summaries, therapy plans, lab samples and diagnostic reports.

Who can see patient records?

Only the roles you allow. Doctors, reception, the lab and accounts each see their own screens, in the ERP and in the AI connector.

Does it handle insurance or panel patients?

There are screens for insurance payors, their contracts, patients' policies and claims. We set them up for the panels you work with.

How we set it up for you

1. **Walk through how you work**
   A short call or a few screenshots per department: what you enter, what you print, which reports you open every day.

2. **Set up and import**
   Your own installation, with your chart of accounts, customers, products and opening balances, checked against your trial balance.

3. **Fit the screens and prints**
   Your field names, invoice and voucher layouts and approval steps, on a copy you test before anything goes live.

4. **Go live and support**
   Start on a month's first day, then training per department and a monthly retainer for questions and changes.
