IrshadOS

Irshad AI ERP: one system for the whole business

Any business that buys, sells and keeps stock

Accounts, sales, a POS counter, purchase, stock, production, payroll and CRM in one ERP built on ERPNext, with modules for schools, clinics, lending and a web shop, which you can also ask in plain language. Works on a phone. Live demo, no sign-up.

Try it now, no sign-up:

Every department in one place

Finance, sales, purchase, stock, production, HR, CRM, complaints, distribution, assets and projects open from one screen, each in its own colour with its own menu, along with modules for schools, clinics, lending and an online shop. Each person sees only the modules their role allows.

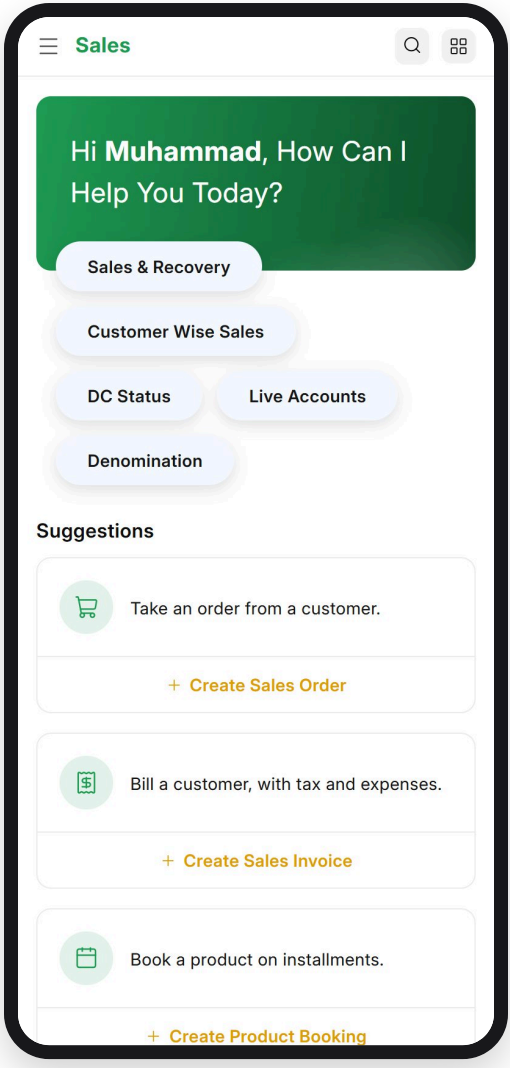

Finance your accountant will recognise

Receipts and payments by cash or cheque, expenses, vouchers, a log of cheques in hand, cash and bank statements, ledgers, profit and loss and the balance sheet, each a tap away.

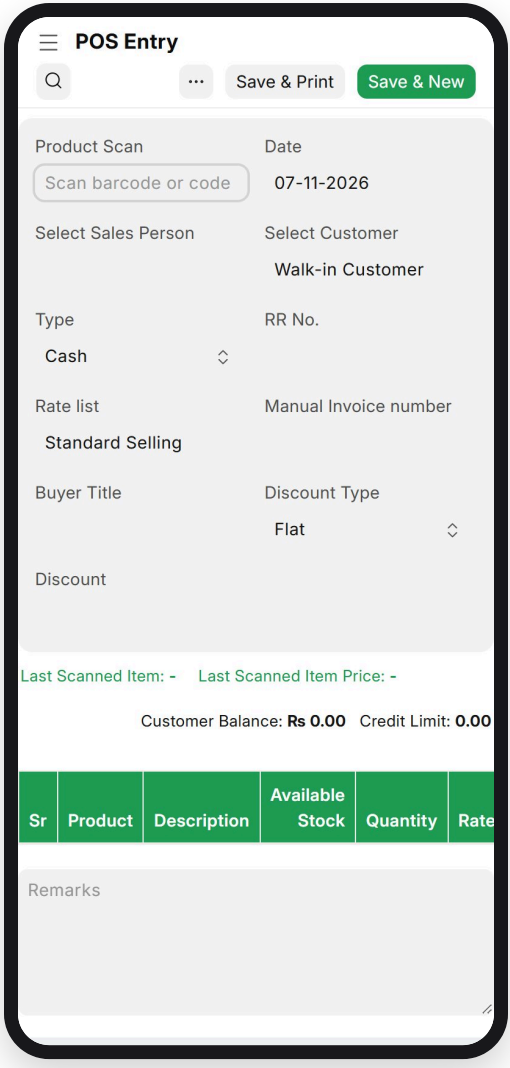

Sales from order to recovery

Quotation, customer order, delivery challan and invoice, with the customer's balance and credit limit in view while you bill. Recovery and customer-wise sales sit on the same screen.

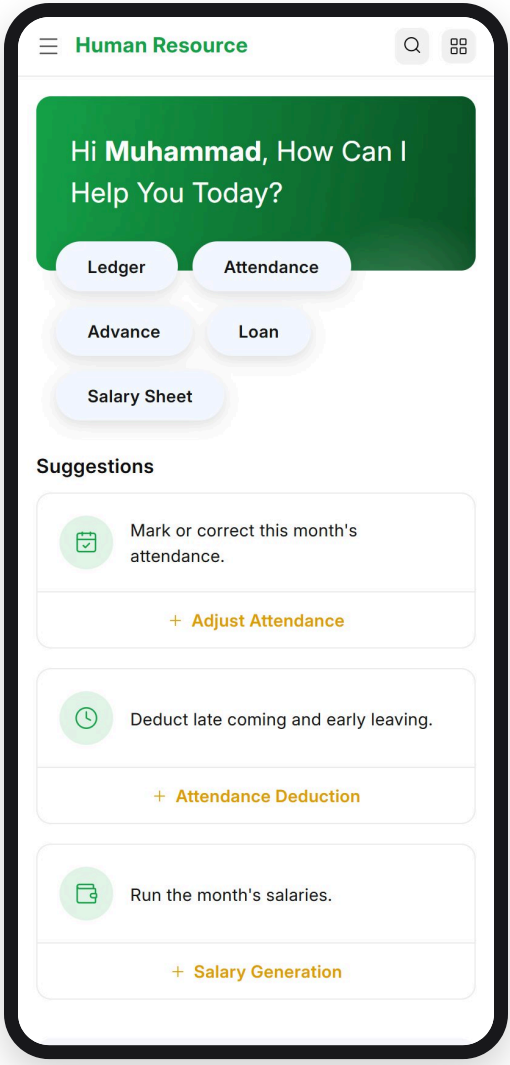

A POS counter for walk-in sales

Scan a barcode, choose cash or credit, apply a discount, take the money and see the change. The bill prints as an 80 mm receipt.

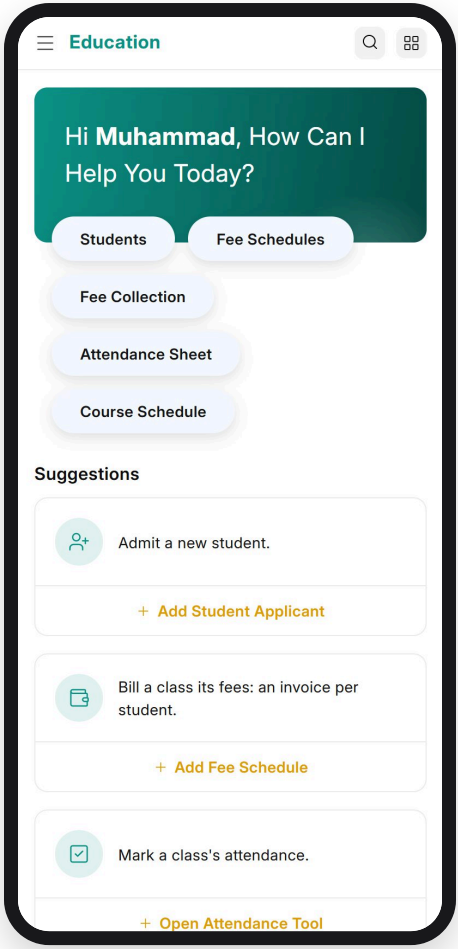

Staff and salaries

Attendance, leave, advances, loans and the monthly salary sheet, with deductions for late coming and early leaving, and salary tax slabs set for your country.

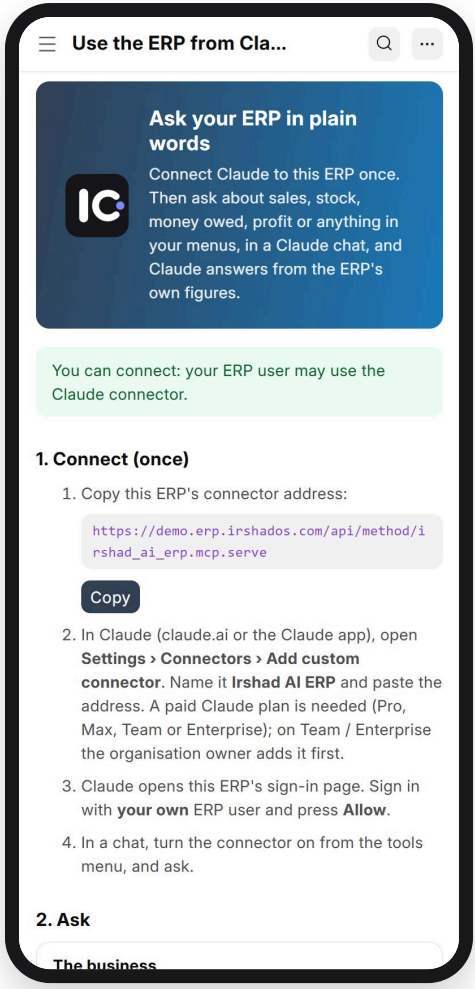

Modules for your industry

Schools get admissions, attendance and fee bills for a whole class. Clinics get patients, appointments and lab tests. Water plants get home orders, delivery riders and the bottles each customer holds. Lenders get loans with payouts and instalments, and shops get a web shop that sells from their own stock. Every one of them posts to the same accounts.

Ask your ERP in plain language

Connect Claude, or another AI assistant that supports the open MCP standard, and ask "who owes us the most?" or "what should we reorder?". It answers from your own books, and it can prepare a voucher or an order for someone to check and approve.

Questions

Does it work on a phone?

Yes. Every picture on this page was taken on a phone-sized screen. It works the same on a computer or tablet, in the browser, with nothing to install.

What is it built on?

ERPNext v16 with Frappe's own open-source apps for HR, CRM, helpdesk, lending, education, healthcare and the web shop, software used by thousands of companies, reshaped screen by screen into one consistent system. You are not locked into a closed product.

Do we need an AI subscription?

No. The ERP works fully on its own. The AI connector is an extra: it needs an AI assistant that supports MCP, such as a paid Claude plan, and each person signs in with their own ERP account.

What does it cost?

It depends on how many people will use it and how much setup you need. Tell us what your business does and how many users you expect, and we send a written quote.

Does it fit our country's taxes?

Currency, financial year, sales tax, VAT or GST, withholding tax and salary tax are settings. Pakistan's FBR sales and salary tax are ready to switch on, and there are screens for the UAE, South Africa, India and the US.

How we set it up for you

1. **Walk through how you work**
   A short call or a few screenshots per department: what you enter, what you print, which reports you open every day.

2. **Set up and import**
   Your own installation, with your chart of accounts, customers, products and opening balances, checked against your trial balance.

3. **Fit the screens and prints**
   Your field names, invoice and voucher layouts and approval steps, on a copy you test before anything goes live.

4. **Go live and support**
   Start on a month's first day, then training per department and a monthly retainer for questions and changes.
